

Appendix H: Construction Impacts
H-2 Transportation

Memorandum

To	Robert Conway
CC	Donald Tone
Subject	Tappan Zee Bridge EIS Construction Impact Assessment
From	William Crowell, Atman Sookram, Jean Michel
Date	October 19, 2011

Introduction and Overview

This memo summarizes the assessment of impacts of the following actions proposed during the construction of a new Tappan Zee Bridge:

- A. Closure of the entrance ramp from S. Broadway to the westbound Thruway at Interchange 9 in Tarrytown;
- B. Closure of the S. Broadway Avenue Bridge over I-287 at Interchange 10 in South Nyack;
- C. Creation of an eastbound off-ramp and a westbound on-ramp to and from River Road in South Nyack to provide access for construction vehicles to the proposed waterfront construction staging area at that location. The existing and proposed merges and diverges will create a ramp-weave condition on eastbound and westbound I-287.

LOS Criteria

LOS D, the minimum LOS design standard for the project setting per NYSDOT design criteria, will be the target for components of proposed roadway facilities (e.g. weaves at Interchange 10) to which construction related volumes were added. Improvement measures were considered for existing facilities (e.g. signalized intersection movements) that deteriorated to LOS F with the addition of the rerouted traffic volumes. As such, results shown in the LOS tables reflect the proposed improvements. Facilities that remained at LOS F will be further discussed.

Analysis and Results

- **Tarrytown (Interchange 9)**

Access to westbound I-287 at Interchange 9 is provided by two entrance ramps: one from South Broadway, another located approximately 2200 feet to the east. With a closure of the entrance ramp from South Broadway, traffic volumes were rerouted to the other entrance ramp through the jughandle at the intersection of South Broadway (US 9) and White Plains Road (NY119), and through the eastbound NY119 right-turn lane at the intersection of NY119 and the entrance and exit ramps to and from westbound I-287. It was projected that during the peak construction period, conservatively assumed to occur in 2017, 216 and 464 vehicles would be rerouted during the AM and PM peak hours, respectively.

Traffic Volumes:

The construction period volumes used for these analyses were based on the following components:

- 2017 volumes at intersections (from October 2011 counts)
- Projected rerouting patterns (see Traffic Rerouting Map and Volumes) due to the closure of the westbound entrance ramp from South Broadway
- 2017 No-Build Thruway volumes for I-287 mainline and Interchange 9 westbound ramps (from TZB EIS)

Figures and Tables (attached):

- Figures 1A and 1B: 2011 Peak Hour Volumes
- Figure 2: Traffic Rerouting
- Figures 3A and 3B: 2017 Construction Volumes
- Tables 1 and 2: LOS Results
- Tables 3-1 and 3-2: Future Construction Volumes (Intersections)

NY119/ US9 Intersection Analysis

With an increase of the maximum green time for the jughandle phase by 5 seconds, the jughandle approach would operate at LOS D and E during the AM and the PM peak hours, respectively without degrading the LOS of other movements and approaches.

NY119/ Interchange 9 Ramps Intersection Analysis

The eastbound NY119 approach features a right-turn lane where RTOR maneuvers were observed. The right-turn lane is projected to operate at LOS A and E during the AM and the PM peak hours, respectively without degrading the LOS of other movements and approaches.

Entrance Ramp to WB I-287 Analysis

The entrance ramp is projected to operate at LOS A and E during the AM and the PM peak hours.

• South Nyack (Interchange 10)

Actions generated the analyses are the proposed new/expanded Entrance and Exit Ramps to River Road construction staging area, and the temporary closure of South Broadway Bridge.

Analysis Locations:

- New weaves on eastbound and westbound I-287 between existing Interchange 10 on- and off-ramps and proposed ramps to and from the construction staging area at River Road. (Weaving Length: Approx. 1500 feet)
- Four (4) Unsignalized Intersections to assess diversions from closure of the S. Broadway Bridge
 - Cornelison Avenue/ South Broadway Avenue
 - South Broadway Avenue/ Hillside Ave
 - Hillside Avenue/ Old Mountain Road (CR 28)
 - Hillside Avenue/ Shadyside Avenue

Traffic Volumes:

- Analysis volumes include the following components:
 - 2017 volumes at intersections (from October 2011 counts)
 - Projected traffic rerouting (see Traffic Rerouting Map and Volumes) due to the closure of South Broadway Bridge

- 2017 No-Build Thruway volumes for I-287 mainline and ramps
- Construction incremental volumes for TZB and landing construction (Ref. staging area at Int. 12)
[Rockland Daily 140 HV, 350 PCEs, See Table for Peak Hour Breakdown]

Key volume findings:

- Broadway Bridge Average Daily Traffic (ADT): 2040 veh/day (1285 NB, 755 SB)
- Non-Thruway Traffic rerouting : Mainly through Hillside Avenue and Shadyside Avenue (See Figure 5 map)
- Differential Running Time for Emergency Vehicle Access with Rerouting: preliminary analysis were completed of potential travel time increases between police, fire and hospital facilities adjacent to [police] or north of Interchange 10 for properties along South Broadway. These travel time estimates, based on projected rerouting patterns, show that response times would be approximately 1-2 minutes greater during the bridge closure, depending on a property's location along South Broadway. Further details on this analysis can be provided if necessary.

Figures and Tables (attached):

- Figures 4A and 4B: 2011 Peak Hour Volumes
- Figure 5: Traffic Rerouting
- Figure 6: Construction Trip Increments
- Figures 7A and 7B: 2017 Construction Volumes
- Tables 1 and 2: LOS Results
- Tables 3-3 and 3-4: Future Construction Volumes (Intersections)
- Table 4: Determination of Construction Trip Increments

Analysis Results:

Thruway Weaves:

- Eastbound I-287: AM LOS D, PM LOS B
- Westbound I-287: AM LOS B, PM LOS D

Ramp Termini at River Road: Design of ramp turning radii and selection of type of control at River Road to be determined during project's design phase.

Unsignalized Intersections:

Three unsignalized intersections operated at LOS C or better with traffic rerouting

- Cornelison Avenue/ South Broadway Avenue
- Hillside Avenue/ Old Mountain Road (CR 28)
- Hillside Avenue/ Shadyside Avenue

At a fourth intersection -- South Broadway Avenue and Hillside Avenue -- the existing LOS F on the southbound South Broadway Avenue approach to Hillside Avenue is projected to continue, along with safety concerns at this location related to the intersection's poor geometry. Appropriate traffic control type and possible geometric improvements can be further analyzed during the design phase.

Conclusions

Tarrytown (Ramp Closure):

- Acceptable operations are projected for the three analysis locations in Tarrytown.

South Nyack (Construction Ramp and S. Broadway Bridge Closure):

- The intersection of South Broadway Avenue and Hillside Avenue would experience operational and safety deficiencies. Appropriate countermeasures (traffic control type and possible geometric improvements) to be defined during the project's design phase.
- LOS D target is met for the new weaves on I-287 at Interchange 10 due to construction ramps.
